

[CentOS-announce] CentOS Stream Container images available on quay.io

NOTE: This message was intended to go to centos-devel and centos-announce on 11-Feb-2021 but it only made it to centos-devel. Thanks to folks on IRC for mentioning that this never made it to the proper announcement channels.

Hi folks,

CentOS Stream container images are now readily available!

```
podman pull quay.io/centos/centos:stream
```

OR

```
podman pull quay.io/centos/centos:stream8
```

Tags

We expect the 'stream' tag to automatically move forward to new Streams as they come on board. This means when CentOS Stream 9 becomes the Live Stream, quay.io/centos/centos:stream will have 9 based content.

The 'stream8' tag can be used while Stream 8 is Live, and during the overlap

period between Stream 8 and Stream 9.

A 'stream9' tag will be created at the appropriate time to serve the same purpose.

You can browse through all of the tags for the CentOS repository here:

<https://quay.io/repository/centos/centos?tab=tags>

Next Steps

– We are still in discussions on how to push these properly to Dockerhub. Since

CentOS is an Official Image, there are some extra requirements here that we're working through.

If you have questions you can find us on the centos-devel mailing list ([hidden email]) or in #centos-stream on Freenode

Cheers!
